

01.

Default Gateway

- **Reason:** Without the correct gateway, the PC does not know how to send data outside of the local network to reach the internet.

DNS Servers (Preferred and Alternate)

- **Reason:** Without DNS, the PC cannot translate website names (like google.com) into the IP addresses needed to load them.

02.

Check the Recycle Bin / Trash

Press Undo: Immediately press **Ctrl + Z** (Windows) or **Cmd + Z** (Mac) to reverse the deletion.

Check Cloud Storage

Use Backups: Restore the file using Windows **File History** or Mac **Time Machine**.

Use Recovery Software: If permanently deleted (Shift + Delete), use a tool like **Recuva** or **Disk Drill** before new data overwrites it.

03.

Re-plug and Swap Ports: Unplug the mouse and keyboard, then plug them into different USB ports (preferably on the back of the PC).

Check for Power: Look for the optical light under the mouse or the Caps Lock light on the keyboard. If no lights are on, the PC itself might be completely frozen; force restart it.

Test on Another PC: Plug them into a different computer. If they work there, the issue is with the original PC's ports or software.

Reinstall Drivers: If you can access the PC remotely, open **Device Manager**, uninstall the keyboard/mouse drivers, and restart the computer to automatically reinstall them.

04. Use Task Manager

05.

Restart the Print Spooler (Best Fix)

Cancel All Jobs

Check Offline Status

Power Cycle

06.

ipconfig /all

ping 192.168.1.1

ping 8.8.8.8

nslookup google.com

ipconfig /release

ipconfig /renew

07.

Static IP: Permanent • Set manually • Used for **servers and printers**.

Dynamic IP: Temporary • Set automatically (DHCP) • Used for **laptops and smartphones**.

08.

Switch: Connects multiple devices together to create a network **inside** a single building or location (LAN). It directs data *between devices* on that same network.

Router: Connects different networks together (like connecting your home network to the **outside** internet). It directs data *between networks*.

09.

Why it happens:

- **The destination is down:** The website, server, or device is turned off or crashed.
- **A firewall blocked it:** Many systems ignore pings for security reasons.
- **Connection issues:** Your internet dropped, or the network is too congested to pass the message through.

10. DHCP
